

TOPIC 3

Matter and Radiation from the Universe

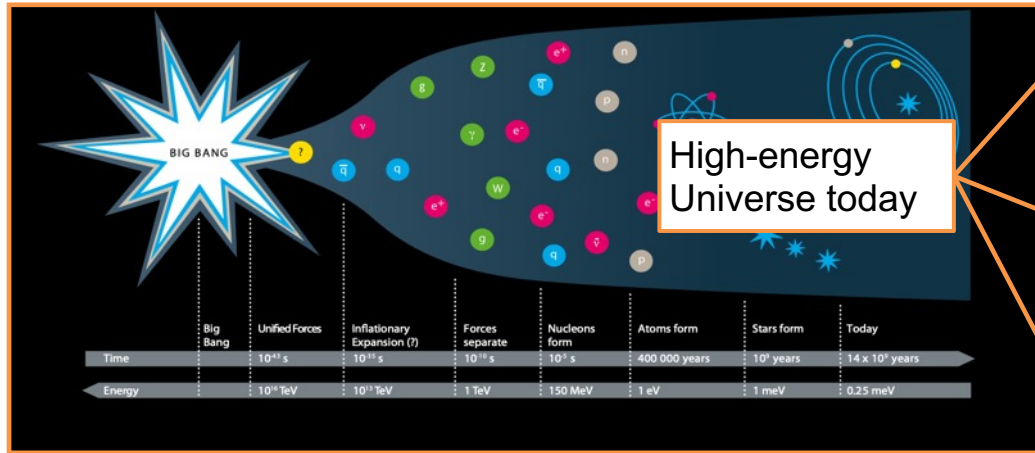

Kathrin Valerius & Christian Stegmann

What we want

Understanding the high-energy Universe and its constituents

A broad but coordinated research program with observatories and in laboratories – a growing field of science

Strong interplay between experiments and theory

Multi-messenger view of the cosmos

Gamma-ray astronomy

Neutrino astronomy

Cosmic rays

Gravitational waves

Understand the role of **neutrinos** in the Universe

Search for new physics and **Dark Matter**

Where we operate

ULTRASAT

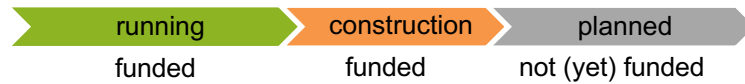

Pierre-Auger Observatory

We have a plan

today

2020 2021 2022 2023 2024 2025 2026 2027 2028 2029

High-energy Universe

Day 1
Published scientific highlights

Day 2 (Kathrin Valerius)
Highlights from the preparations of our next steps

Gamma-ray Astronomy

In the front row at a cosmic explosion

The best view yet of a gamma ray burst (GRB)

An increasing sample of detections

GRB 190114C

MAGIC

Nature 575 (2019) 455

Nature 575 (2019) 459

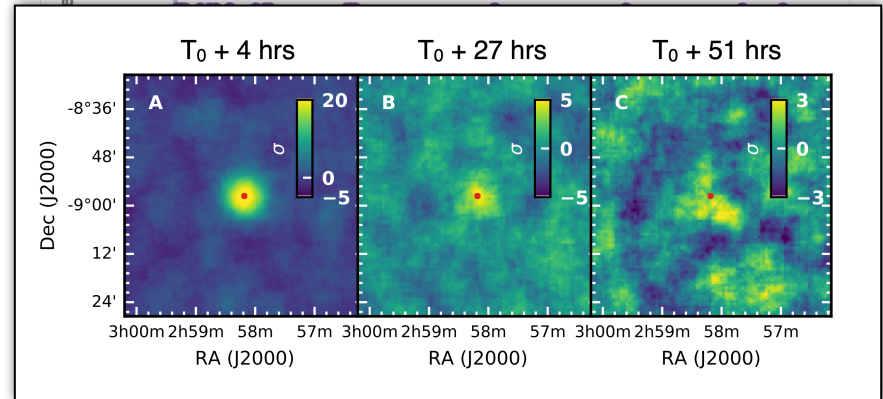

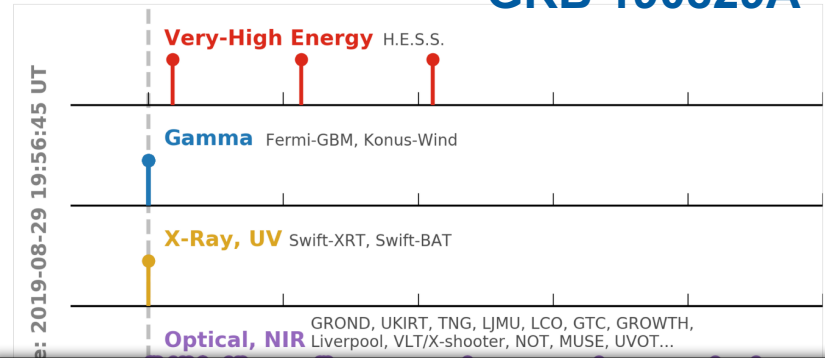

GRB 180720B

H.E.S.S., Nature 575 (2019) 464

GRB 190829A

H.E.S.S., Science 372 (2021) 1081

GRB 190829A

The Spectrum of GRB 190829A

is challenging theory

- Curiously, the most recent HESS GRB detection is compatible with a continuation of the synchrotron emission beyond the expected supposed theoretical limit
- We are finally starting to probe the very high energy (TeV) gamma-ray emission from GRB, allowing us to start probing the magnetic fields in the source

HESS, Science 2021

Neutrino Astronomy

High-energy Neutrinos

in coincidence with the disruption of stars near black holes (TDE)

- The **IceCube-191001A-AT2019dsg** association represents the first step in the study of high-energy particle emission from TDEs.
- Possible due to the implementation of realtime alert systems (**AMPEL**)
- + theoretical modelling (W. Winter, C.Lunardini, Nature Astronomy 5, 472 (2021))
- additional candidates under investigation: e.g. **IC200530A-AT2019fdr**, S. Reusch et al, submitted to PRL <https://arxiv.org/abs/2111.09390> and van Velzen et al, submitted to Science <https://arxiv.org/abs/2111.09391>

R. Stein, et al., Nature Astronomy 5, 510 (2021)

Zwicky Transient Facility (ZTF)

N. Gehrels Observatory (Swift)

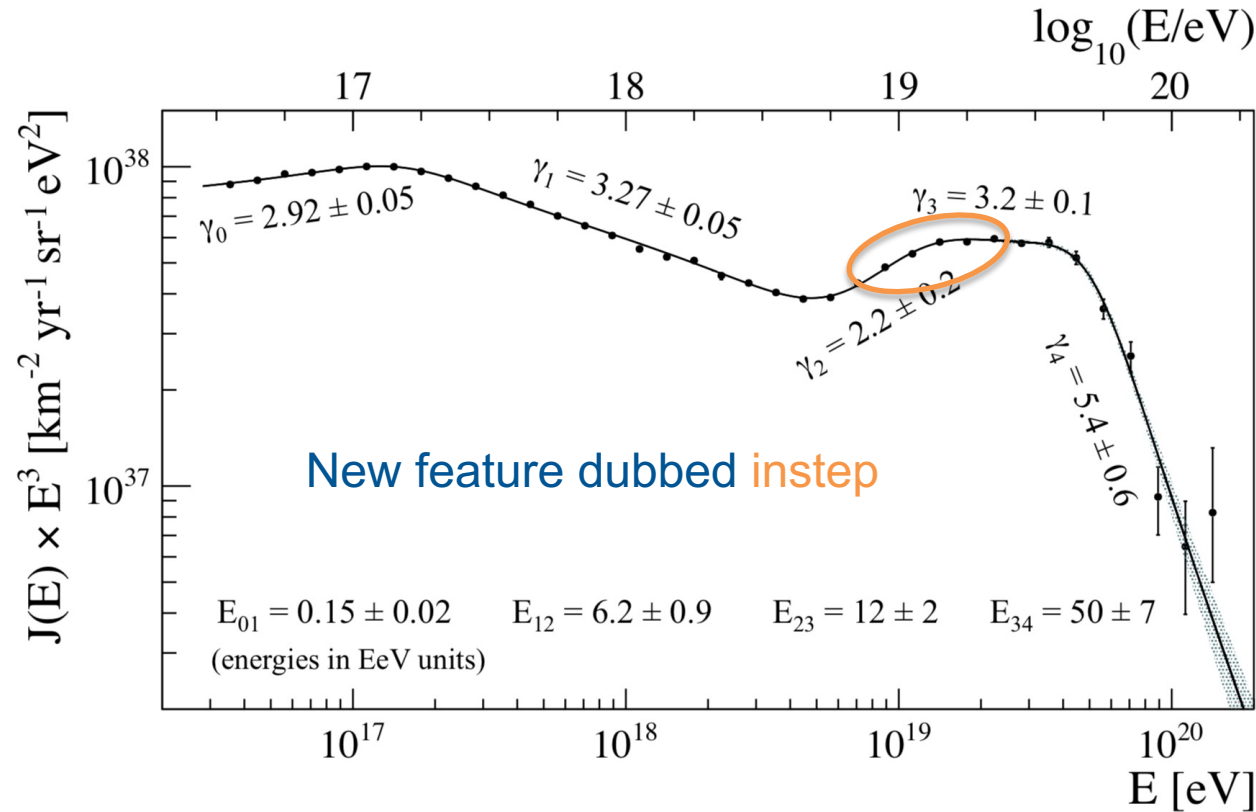

Cosmic Rays

Energy spectrum of the highest energy particles

allows an unprecedented view of the Universe at the highest energies

	Exposure [$\text{km}^2 \text{sr yr}$]	Events
SD1500 ($\vartheta < 60^\circ$)	60426	215030
SD1500 ($\vartheta > 60^\circ$)	17447	24209
SD750	105.4	569285
Hybrids	2248 (10^{19} eV)	13655
Cherenkov	286 (10^{17} eV)	69793

Stat. uncertainty very small
Sys. uncertainty dominating

Interpretation of flux and composition data

$A = 1$
 $1 < A < 5$
 $4 < A < 23$
 $22 < A < 39$
 $38 < A < 57$

Bands:
 Experimental uncertainties
 (model uncertainties smaller)

Energy scale: $\sigma_{\text{sys}}(E)/E = 14\%$

X_{max} scale: $\sigma_{\text{sys}}(X_{\text{max}}) = 6 \div 9 \text{ g cm}^{-2}$

Different model scenarios considered for low-energy part
 (transition to galactic component), similar results for total composition obtained

$$J(E) = \sum_A f_A \cdot J_0 \cdot \left(\frac{E}{E_0}\right)^{-\gamma} \cdot \begin{cases} 1, & E < Z_A \cdot R_{\text{cut}}; \\ \exp\left(1 - \frac{E}{Z_A \cdot R_{\text{cut}}}\right), & E > Z_A \cdot R_{\text{cut}}. \end{cases}$$

$$R_{\text{cut}} = 1.4 \dots 1.6 \times 10^{18} \text{ V}$$

Flux suppression superposition
 of injection maximum energy
 and propagation energy losses

Extragalactic index very hard, but no really good handle on this parameter

(Guido, Auger ICRC 2021)

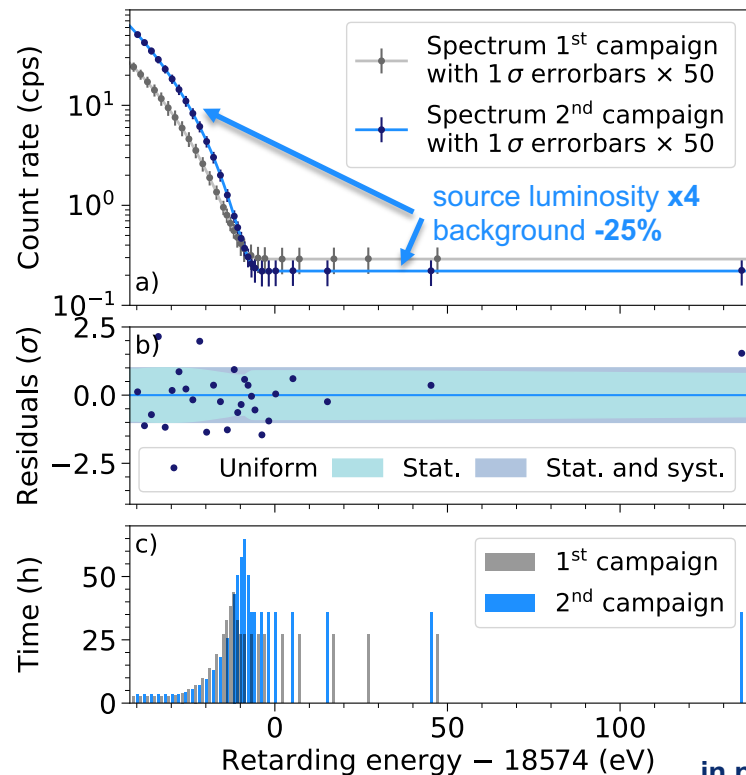

KATRIN

© KATRIN Coll.

Karlsruhe Tritium Neutrino experiment (KATRIN)

First direct neutrino-mass measurement with sub-eV sensitivity

Best-fit result (2nd campaign):

$$m_\nu^2 = 0.26 \pm 0.34 \text{ eV}^2$$

Upper limit (2019 data combined):

$$m_\nu < 0.8 \text{ eV (90\% CL)}$$

Only 5% of total anticipated data unblinded.

Ca. 1/3 of total anticipated data now on disk.

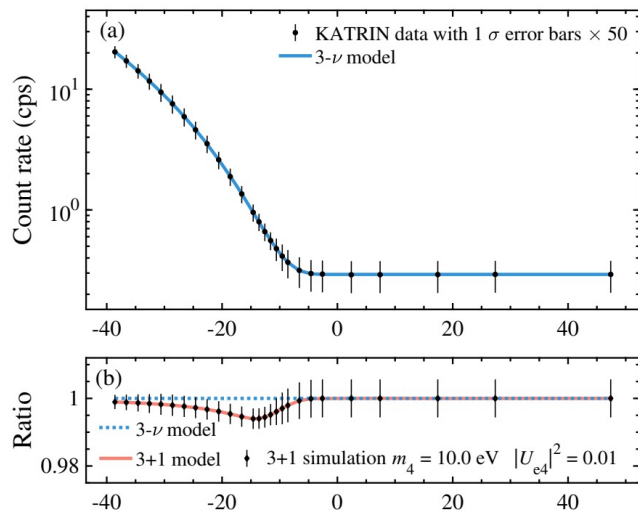

arXiv:2105.08533,
in print at Nature Physics

Karlsruhe Tritium Neutrino experiment (KATRIN)

Physics program beyond the neutrino mass

- Test of Lorentz invariance violation in weak decays
- Probe of local overdensities of relic neutrinos
- Probe of non-standard neutrino interactions
- Test of light (eV scale) sterile neutrino hypothesis

1st campaign:
PRL 126 (2021) 091803

- Mainz 95 % C.L.
- Troitsk 95 % C.L.
- Prospect 95 % C.L.
- DANSS 95 % C.L.
- Daya Bay 90 % C.L.
- Double Chooz 95 % C.L.
- Stereo 95 % C.L.
- RAA 95 % C.L.
- BEST + GA 95.45 % C.L.
- Neutrino-4 2σ
- KATRIN (KSN1) 95 % C.L.
- KATRIN (KSN1+2) sensitivity 95 % C.L.
- Projected KATRIN final sensitivity 95 % C.L.

2nd campaign: publication in prep.

UHECRs and neutrinos from AGN jets

Hypotheses:

- AGN jets (aligned+mis-aligned) describe UHECR data
- Mis-aligned AGN have same properties as AGN blazars
- Injection composition fixed (roughly Galactic)

- Population model from [Ajello et al, 2012+2014:](#)

- Three classes (allowing for different baryonic loadings)

- LL-BL Lacs
- HL-BL Lacs
- FSRQs

- Neutrino production model and spectral energy distribution model based on [Rodrigues, Fedynitch, Gao, Boncioli, Winter, ApJ 854 \(2018\) 54](#)

Conclusion:

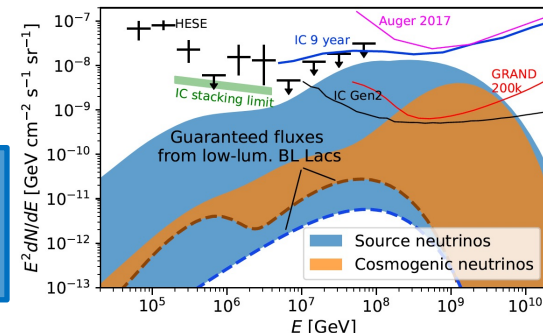

1. UHECR description driven by LL-BL Lacs because of
 - Low luminosity → rigidity-dependent max. energy
 - Negative source evolution

2. Neutrinos mostly come from FSRQs, peak at high energies, and may outshine the cosmogenic flux there

[Rodrigues, Heinze, Palladino, van Vliet, Winter, PRL 126 \(2021\) 191101](#)

Is the cosmogenic neutrino flux really the foreground at EeV energies?

Emission and spectral index maps of supernova remnants

Pion decay (PD)-emission:

- Shell-like morphology throughout all phases and energies
- Faint halo emission

IC-emission:

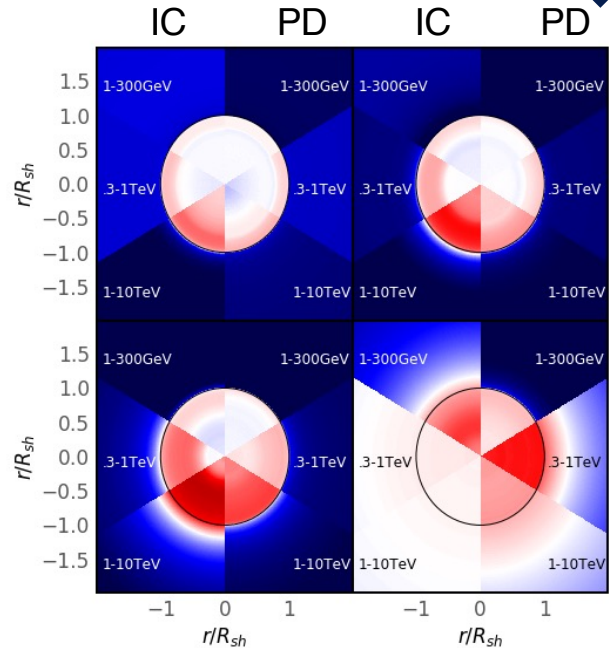

- Initially shell-like morphology
- Transition to center-filled
- Halo emission already after 2kyr

Spectral index distribution:

- No significant deviation from regions of brightest emission

← Emission maps
Spectral index deviation maps ↓

Gravitational Wave Astronomy

Visualization of two merging black holes emitting gravitational waves, Max Planck Institute for Gravitational Physics

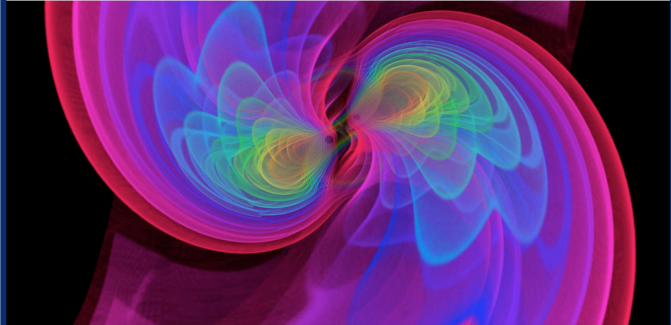

Gravitational Wave Astronomy

with the Einstein Telescope

- Many activities in participating centers started, ranging from theory to contributions to the instrument to coordination
- **Helmholtz-Roadmap:** The FIS Commission recommends the project for full application (2021).
- **DZA in Lusatia:** The proposed German Center for Astrophysics (DZA) – one of its three pillars dedicated to the Einstein telescope – is among the final 6 proposals for two research centers in Saxony.. (<https://www.deutscheszentrumastrophysik.de/de>)
