# **Problems in the SM**

- SM fails to explain neutrino mass and mixings.
- SM doesn't have a DM candidate.
- SM can not explain the observed baryon asymmetry.
- The origin of smallness of the  $\theta$ -parameter.

## Strong CP Problem

The measurement of nEDM  $d_n$  will imply P, CP violation and could be related to the early matter-antimatter asymmetry.

$$
H = -d_n E.\hat{S}
$$
  

$$
L = -d_n \frac{i}{2} \bar{n} \sigma_{\mu\nu} \gamma_5 n F^{\mu\nu}
$$

 $\blacktriangleright$  nEDM puts bound on d<sub>n</sub> *i.e.*  $|d_n| < 1.5 \times 10^{-12}$ e GeV<sup>-1</sup> Abel et al, PRL 20

 $L_{\theta} = \theta \frac{g_s^2}{32\pi^2} G \tilde{G}$  contribution to nEDM which comes out as  $d_n \sim 1.2 \times 10^{-2} \theta e GeV^{-1}$ Pospelov, Ritz '99

**EXECUTE:** Comparing theoretical and the experimental values of nEDM, we obtain  $\theta < 10^{-10}$ 

 $\blacktriangleright$  The problem arises why the  $\theta$  parameter is so small

#### Gauge group and Particle content

## Accidental Symmetry

#### **Complete gauge group**  $\longrightarrow SU(3)_c \times SU(2)_L \times U(1)_Y \times U(1)_X \times U(1)_{PO} \times \mathbb{Z}_2$

- KSVZ type axion model has been considered
- $\mathbb{Z}_2$ -symmetry forbids mixing among the exotic quarks and also stabilise the FIMP DM
- We have two DM namely axion and right handed neutrino which is odd under  $\mathbb{Z}_2$
- $\bullet$   $U(1)_{\rm PQ}$  symmetry is accidental and extracted from  $U(1)_X$  gauge symmetry

Gauge anomaly will put bound on the additional abelian gauge group charges

Lagrangian	Full Lagrangian	$\mathcal{L} = \mathcal{L}_{SM} + \mathcal{L}_{N}^{Yukawa for RHN}$
SMLagrangian	Wukawa for RHN	

Lagrangian associated with the right handed neutrinos:

$$
\mathcal{L}_{N}^{Yuk} = y_{\mu 2} \bar{L}_{\mu} \phi_{h} N_{2} + y_{\mu 3} \bar{L}_{\mu} \phi_{h} N_{3} + y_{\tau 2} \bar{L}_{\tau} \phi_{h} N_{2} + y_{\tau 3} \bar{L}_{\tau} \phi_{h} N_{3} + y_{e2} \bar{L}_{e} \phi_{h} N_{2} \frac{\phi_{1}}{M_{PL}} \longrightarrow \text{Dirac mass terms}
$$
\n
$$
+ y_{e3} \bar{L}_{e} \phi_{h} N_{3} \frac{\phi_{1}}{M_{PL}} + y_{22} N_{2} N_{2} \frac{\phi_{1} \phi_{2}}{M_{PL}} + y_{23} N_{2} N_{3} \frac{\phi_{1} \phi_{2}}{M_{PL}} + y_{33} N_{3} N_{3} \frac{\phi_{1} \phi_{2}}{M_{PL}} + h.c. . \longrightarrow \text{RHN mass terms}
$$

Terms associated with the exotic quarks:  $\mathcal{L}_{BSM}^{Yuk}$ 

$$
= \sum_{i,j=1}^{N_{\psi}0} \lambda_{ij} \,\bar{\psi}_L^i \psi_R^j \phi_1 + \sum_{i,j=1}^{N_{\chi}} y_{ij} \bar{\chi}_L^i \chi_R^j \phi_2 + h.c. .
$$

Redefining the fields:  $\psi_L \rightarrow e^{i\frac{a_1}{2v_1}}, \ \psi_R \rightarrow e^{-i\frac{a_1}{2v_1}}, \ \chi_L \rightarrow e^{i\frac{a_2}{2v_2}}, \ \chi_R \rightarrow e^{-i\frac{a_2}{2v_2}}$ 

Axion gluon coupling:

\n
$$
\mathcal{L}_{AGG} = \left( \frac{N_{\psi} a_1}{v_1} + \frac{N_{\chi} a_2}{v_2} \right) \frac{g_s^2}{32\pi^2} G_{\mu\nu} \tilde{G}^{\mu\nu}
$$
\n
$$
A = \frac{v_2 a_1 + n_{\chi} v_1 a_2}{\sqrt{n_{\chi}^2 v_1^2 + v_2^2}} \quad F_a = \frac{v_1 v_2}{\sqrt{n_{\chi}^2 v_1^2 + v_2^2}}
$$
\n
$$
= N_{\psi} \frac{A}{F_a} \frac{g_s^2}{32\pi^2} G_{\mu\nu} \tilde{G}^{\mu\nu} ,
$$

## Choice of  $\alpha_{\rm L}$  and  $\beta_{\rm L}$

$$
\frac{U(1)_X^3 \text{ and } [Gravity]^2 \times U(1)_X}{\text{where } z = \frac{\beta_L}{\alpha_R}, \ n_\chi = \frac{N_\chi}{N_\psi} \text{ and } y = \frac{\beta_R - \beta_L}{\alpha_R} = \frac{\Delta \beta_L}{\alpha_R}
$$
\n
$$
\text{Roots and condition}
$$
\n
$$
y_{\pm} = \frac{-3(n_\chi - z) \pm \sqrt{9(n_\chi - z)^2 - 12(n_\chi^2 - 1)(1 - z^2)}}{2(n_\chi^2 - 1)}
$$
\n
$$
z_{\pm} = \frac{3n_\chi \pm 2[n_\chi^2 - 1]}{(4n_\chi^2 - 1)}
$$

Sets of Allowed  $\rightarrow$ Charge assignments

$$
n_e = -\frac{1 + n_\chi}{2} (\beta_L - \beta_R), \ n = \frac{n_\chi - 1}{2} (\beta_L - \beta_R) \text{ and } m = -\frac{n_e + 2n}{9} \quad \boxed{6}
$$

Analytical Estimate of 
$$
\Delta\theta
$$
  
\n
$$
\underbrace{v_1 = v_2 \text{ and } |g| \sim 1} \rightarrow \Delta\theta \sim \frac{1}{n_x!} \left[\frac{1 + n_x^2}{2}\right]^{\frac{1 + n_x}{2}} \left[\frac{F_a^2}{f_\pi m_\pi}\right]^2 \left[\frac{F_a}{M_{PL}}\right]^{n_x - 3} \frac{(m_u + m_d)^4}{m_u^2 m_d^2}
$$
\n\nStirling's formula for  $n_\chi \gg 1$   
\n
$$
\Delta\theta \sim \frac{e^{\pi_\chi}}{(\sqrt{2})^{1 + n_\chi}} \left[1 + \frac{1}{n_\chi^2}\right]^{\frac{1 + n_\chi}{2}} \sqrt{\frac{n_\chi}{2\pi} \left[\frac{F_a^2}{f_\pi m_\pi}\right]^2 \left[\frac{F_a}{M_{PL}}\right]^{n_\chi - 3} \frac{(m_u + m_d)^4}{m_u^2 m_d^2}}
$$
\n\nRule out by nEDM\n\n
$$
\overline{n_\chi} \leq 8 \longrightarrow \Delta\theta \geq 10^{-10}
$$
\n
$$
\overline{n_\chi} \equiv 9 \longrightarrow \Delta\theta \sim 29.41 \times 10^{-10} \left[\frac{F_a}{10^{10} \text{GeV}}\right]^{10}
$$

Running of SU(3) coupling above the EQ mass scale

$$
\beta_3(\alpha_3) = -\frac{\alpha_3^2}{2\pi} \left[ 7 - \frac{2(N_\psi + N_\chi)}{3} \right] \quad \Longrightarrow \quad N_\psi + N_\chi \le 10
$$

8

#### Axion relic density using misalignment:

$$
\Omega_a h^2 \simeq 0.18\,\theta_i^2 \left(\frac{F_a}{10^{12}\,\text{GeV}}\right)^{1.19} \quad \boxed{\text{Turner et al '85}}
$$

- $n_\chi = 10\,$  can not give us total amount for dark matter although not true for higher  $n_x$  values.
- $n_{\rm v}=12$  Can give right relic density for part of the parameter space.
- From the asymptotic freedom we can not take high value of  $n_{\chi}$ .
- We need a second component to fill the gap to the total DM relic density.

 $N_1$  as FIMP

In the present work, we can consider one of the RHN as DM which is odd under  $\mathbb{Z}_2$ 

Lagrangian for the DM candidate  $N_1$ :  $\mathcal{L}_{N_1} = \frac{i}{2} \bar{N}_1 \gamma^{\mu} \left( \partial_{\mu} - i g_X^{eff} Z_X \right) N_1 + \lambda \bar{N}_1^c N_1 \frac{\phi_1^{\mu} \phi_2}{M_{\text{Pl}}} + h.c.$ 

- FIMP is produced from the decay of  $h_i$  and  $Z_x$
- $Z_X$  never reaches thermal equilibrium so we have determined its distribution function.

Analytical estimate of FIMP DM

$$
\underline{\mathsf{h}_\mathrm{i}\rightarrow\mathsf{N}_1\mathsf{N}_1\text{ decays contribute to the FIMP DM}}; \quad \underline{\mathsf{\Omega}^{FIMP}_{N_1}h^2\sim\frac{2.038\times10^{27}}{g_s\sqrt{g_\rho}}\sum_i\frac{M_{N_1}^3}{16\pi M_{h_i}\;F_a^2(n_\chi^2+1)}
$$

 $h_i \to Z_X Z_X \to N_1 N_1$  decays contribute to the FIMP DM;

$$
\boxed{(\Omega_{N_1}^{SF} h^2) \sim \frac{2.038 \times 10^{27}}{g_s \sqrt{g_\rho}}\, 2 B R_{Z_X \rightarrow N_1 N_1} \sum_i \frac{M_{N_1} q_i^2 M_{h_i}}{32 \pi q_2^2 (n_\chi^2 + 1)^2 F_a^2}}
$$

 $Z_{\rm X} \rightarrow N_1 N_1$  branching analytically can be approximated as

$$
2BR_{Z_X \to N_1 N_1} = \frac{2}{24} \frac{(n_\chi + 1)^2}{n_\chi^2 - 8n_\chi + 28/3} \to \frac{1}{12}, \text{ for } n_\chi \gg 1
$$

In the DM scatter plots, we have considered contribution both axion and FIMP DM

 $\rightarrow$  Higher values of FIMP DM mass are ruled out due to over production of DM

- Present model can generate oscillation parameters in the correct range by varying the model parameters
- The lightest **eigenvalue** among the active neutrinos **is zero** since the mixing involves only two RHN

# Conclusion

- ➢ Present model can accommodate neutrino mass with the allowed range of the neutrino oscillation parameters.
- $\geq$  It also explain the smallness of the  $\theta$ -parameter and solves the strong CP problem naturally.
- $\rightarrow$  With asymptotic freedom, we could have a not so small contribution to  $\theta$  which corresponds to small  $F_a$  and may be measured in near future experiments.
- $\geq$  Unless we choose very high value of  $n_{\chi}$  ( $\geq$  12) which might ruin the asymptotic freedom of QCD coupling, axion can not accommodate whole amount of DM relic density.
- ➢ ADMX, MADMAX, babyIAXO can explore the present model for axion mass range from  $\mu$ eV and above, even if axion is not the total DM density.
- ➢ One of the right handed neutrino can be a FIMP DM and fill the deficit in the total DM relic density.
- ➢ RH FIMP DM is produced from the decay of thermal Higgses and non-thermal gauge boson.
