To generate Dirac masses for ν like other SM fermions, we need ν_R

$$\mathcal{L}_{\nu \text{ Yuk.}} = -y_{\nu} \overline{L} \tilde{\Phi} \nu_{R} + H.c. = -y_{\nu} \left(\overline{\nu_{L}} \quad \overline{\ell_{L}} \right) \begin{pmatrix} \langle \Phi \rangle + h \\ 0 \end{pmatrix} \nu_{R} + H.c.$$
$$= \underbrace{-y_{\nu} \langle \Phi \rangle}_{=m_{D}} \overline{\nu_{L}} \nu_{R} + H.c. + \dots$$

 ν_R do not exist in the SM, so hypothesize that they do and $\nu_R = \nu_R^c$:

< @ ▶ < 분 ▶ < 분 ▶ 분 1 ○ 오 (~ 12 / 38 To generate Dirac masses for ν like other SM fermions, we need ν_R

$$\mathcal{L}_{\nu \text{ Yuk.}} = -y_{\nu} \overline{L} \tilde{\Phi} \nu_{R} + H.c. = -y_{\nu} \left(\overline{\nu_{L}} \quad \overline{\ell_{L}} \right) \begin{pmatrix} \langle \Phi \rangle + h \\ 0 \end{pmatrix} \nu_{R} + H.c.$$
$$= \underbrace{-y_{\nu} \langle \Phi \rangle}_{=m_{D}} \overline{\nu_{L}} \nu_{R} + H.c. + \dots$$

 ν_R do not exist in the SM, so **hypothesize** that they do and $\nu_R = \nu_R^c$:

After diagonalizing the mass matrix, identify ν_L (chiral eigenstate) in the SM as a linear combination of mass eigenstates:

technical comments on high- and low-scale Seesaws (for experts)

R. Ruiz (IFJ PAN)

LNV@FCC – BLV24

<ロト < 部ト < 目ト < 目ト 三日 のへで LV24 13 / 38 In pure Type I scenarios (SM+ ν_R), tiny m_{ν} obtained in two ways:

greatly clarified by Pascoli, et al, [1712.07611]

~

High-scale seesaw:

$$\Lambda_{LNV} \gg y_{\nu} \langle \Phi_{SM} \rangle \implies m_{\nu} \sim m_D \left(\frac{m_D}{\Lambda_{LNV}} \right), \ m_N \sim \Lambda_{LNV}$$

Generically leads to decoupling of high-mass N and LNV from colliders

2 Low-scale seesaw:

$$\Lambda_{LNV} \ll y_{\nu} \langle \Phi_{SM} \rangle \implies m_{\nu} \sim \Lambda_{LNV} \left(\frac{m_D}{m_R} \right)^2, \ m_N \sim m_R$$

Known also in literature as Inverse Seesaw, Linear Seesaw, Protective Symmetries, etc.

R. Ruiz (IFJ PAN

LNV@FCC – BLV24

<ロト < 部ト < 言ト < 言ト 三 言 の < で V24 14 / 38 In pure Type I scenarios $(SM + \nu_R)$, tiny m_{ν} obtained in two ways:

greatly clarified by Pascoli, et al, [1712.07611]

2

High-scale seesaw:

$$\Lambda_{LNV} \gg y_{\nu} \langle \Phi_{SM} \rangle \implies m_{\nu} \sim m_D \left(\frac{m_D}{\Lambda_{LNV}} \right), \ m_N \sim \Lambda_{LNV}$$

Generically leads to decoupling of high-mass N and LNV from colliders

Low-scale seesaw:

$$\Lambda_{LNV} \ll y_{\nu} \langle \Phi_{SM} \rangle \implies m_{\nu} \sim \Lambda_{LNV} \left(\frac{m_D}{m_R} \right)^2, \ m_N \sim m_R$$

Known also in literature as Inverse Seesaw, Linear Seesaw, Protective Symmetries, etc.

Corollary #1: In low-scale Type I, if $m_{\nu} \approx 0$ on scale of expt. i.e., $(m_{\nu}^2/Q^2)^k \approx 0$ \implies approx. *L* conservation

Pilaftsis, et al [hep-ph/9901206]; Kersten & Smirnov [0705.3221]; Pascoli, et al, [1712.07611]; w/ Pascoli [1812.08750]

In pure Type I scenarios $(SM + \nu_R)$, tiny m_{ν} obtained in two ways:

greatly clarified by Pascoli, et al, [1712.07611]

2

High-scale seesaw:

$$\Lambda_{LNV} \gg y_{\nu} \langle \Phi_{SM} \rangle \implies m_{\nu} \sim m_D \left(\frac{m_D}{\Lambda_{LNV}} \right), \ m_N \sim \Lambda_{LNV}$$

Generically leads to decoupling of high-mass N and LNV from colliders

Low-scale seesaw:

$$\Lambda_{LNV} \ll y_{\nu} \langle \Phi_{SM} \rangle \implies m_{\nu} \sim \Lambda_{LNV} \left(\frac{m_D}{m_R} \right)^2, \ m_N \sim m_R$$

Known also in literature as Inverse Seesaw, Linear Seesaw, Protective Symmetries, etc.

Corollary #1: In low-scale Type I, if $m_{\nu} \approx 0$ on scale of expt. i.e., $(m_{\nu}^2/Q^2)^k \approx 0$ \implies approx. *L* conservation

Pilaftsis, et al [hep-ph/9901206]; Kersten & Smirnov [0705.3221]; Pascoli, et al, [1712.07611]; w/ Pascoli [1812.08750]

Corollary #2: Collider-scale LNV via N_i with $m_N \gtrsim M_W$ \implies **larger active particle spectrum!**

senior postdoc vacancy in Krakow

3-year Adv/Senior Postdoctoral Researcher in Theoretical Particle Physics

Cracow, INP · Europe

hep-ph	hep-th	nucl-th	PostDoc
--------	--------	---------	---------

① Deadline on Nov 15, 2024

Job description: Job Title: Adv/Senior Postdoctoral Researcher

The Department of Theoretical Particle Physics (NZ42) at the Institute of Nuclear Physics – Polish Academy of Sciences (IFJ PAN) in Krakow, Pola postdoctoral appointment ("adjunct" in Polish) in the group of Prof. Richard Ruiz.

The Black Box Theorem

R. Ruiz (IFJ PAN)

LNV@FCC – BLV24

2 / 9

In '82, Schechter & Valle published (PRD'82) a seminal finding:

- Suppose $0\nu\beta\beta$ is mediated within "a 'natural' gauge theory" $\Delta L = -2 \text{ process}$
- *u*, *d* and *e*⁻ all carry weak charges

FIG. 1. Diagrams for neutrinoless double- β decay in an SU(2)×U(1) gauge theory. The standard diagram is Fig. 1(a). It is the only one which contains a virtual neutrino (of four-momentum p). d and u are the down and up quarks.

EL SQA

In '82, Schechter & Valle published (PRD'82) a seminal finding:

• Suppose $0\nu\beta\beta$ is mediated within "a 'natural' gauge theory" $\Delta L = -2 \text{ process}$

• *u*, *d* and *e*⁻ all carry weak charges

- always possible to build a many-loop,
 2-point graph with external ν_L, ν^c_L
- $0\nu\beta\beta$ generates a Majorana mass for ν
- holds generally for other $\Delta L \neq 0$ process for further discussions, see:

Hirsch, et al [hep-ph/0608207] and Pascoli, et al [1712.07611]

FIG. 2. Diagram showing how any neutrinoless double- β decay process induces a \overline{v}_e -to- v_e transition, that is, an effective Majorana mass term.

The Dirac-Majorana Confusion Theorem

R. Ruiz (IFJ PAN)

LNV@FCC – BLV24

In '82, Kayser also published (PRD'82) a seminal finding:

refined later by Mohapatra & Pal ('98)

The helicity amplitude for the LNC process $W^+ \rightarrow \ell_1^+ \ell_2^- f \overline{f'}$ is

 $\mathcal{M}_{LNC} = \varepsilon_{\mu} T^{\rho\mu}_{LNC} \Delta^{W}_{\nu\rho} J^{\nu}_{f_{1}f_{2}} \mathcal{D}(\rho_{\nu})$

Intuition: successive LH chiral interactions \implies LH helicity eigenstate

$$T_{LNC}^{\rho\mu} = \overline{u_L}(p_2)\gamma^{\rho}P_L \times (\underbrace{p_{\nu}}_{\text{LH helicity state}} + \underbrace{m_{\nu}}_{P_L m_{\nu} P_R = 0}) \times \gamma^{\mu}P_L v_R(p_1)$$
$$\implies \mathcal{M}_{LNC} \sim \frac{p_{\nu}}{p_{\nu}^2 - m_{\nu}^2}$$

R. Ruiz (IFJ PAN)

LNV@FCC - BLV24

6/9

The helicity amplitude for the LNV process $W^+ \rightarrow \ell_1^+ \ell_2^+ \overline{f} f'$ is

 $\mathcal{M}_{LNV} = \varepsilon_{\mu} T^{\rho\mu}_{LNV} \Delta^{W}_{\nu\rho} J^{\nu}_{f_2 f_1} \mathcal{D}(p_{\nu})$

Intuition: CPT Theorem \implies C-inversion = PT-inversion

$$T_{LNV}^{\rho\mu} = \overline{u_R}(p_2)\gamma^{\rho} \underbrace{P_R}_{CPT: \ P_L \to P_R} \times (\underbrace{p_{\nu}}_{P_R \ p_{\nu} \ P_R=0} + \underbrace{m_{\nu}}_{\text{RH helicity state}}) \times \gamma^{\mu} P_L v_R(p_j)$$
$$\implies \mathcal{M}_{LNV} \sim \frac{m_{\nu}}{p_{\nu}^2 - m_{\nu}}$$

Confusion Theorem: In SM + Majorana ν , the rate of LNV~ $\mathcal{O}(m_{\nu})$; in the limit where $(m_{\nu}^2/M_W^2) \rightarrow 0$, Dirac behavior recovered

holds for other gauge theories with Majorana fermions Han, RR, et al [1211.6447]; RR [2008.01092]

technical comments on high- and low-scale Seesaws (for experts)

For super experts

What about quasi-degenerate Majorana neutrinos?

Wolfenstein ('81), Petcov ('82)

Low-scale Seesaws assume SM+ ν_R +S \implies 3 mass states per generation:

(for a review, see C. Weiland's thesis [1311.5860])

$$m_{
u} \sim \underbrace{\bigwedge_{LNV}}_{\text{this is small!!}} \left(\frac{m_D}{m_R}\right)^2 \qquad m_{N_{1,2}} \sim \pm \left(\sqrt{m_R^2 + m_D^2} \mp \mathcal{O}(\bigwedge_{LNV})\right)$$

For super experts

What about quasi-degenerate Majorana neutrinos?

Wolfenstein ('81), Petcov ('82)

Low-scale Seesaws assume $SM + \nu_R + S \implies 3$ mass states per generation:

(for a review, see C. Weiland's thesis [1311.5860])

In $m_{\nu} \rightarrow 0$ limit (typical for LHC), $m_{N_2} \rightarrow m_{N_1}$ and $\Delta \phi \rightarrow \pi$:

2 quasi-degenerate, Majorana N_i with opposite CP phase ≈ 1 Dirac N_i
