# Conclusions

D<sup>3</sup>PO decomposed Fermi data (Selig et al. 2014, 2015) shows

- cold ISM gamma component (hadronic emission)
- hot ISM gamma component (IC emission)
- point sources

Assuming this to be the non-DM Galactic model we

- confirm presence of DM-like central Galactic gamma excess
- find also preference of data for such DM-like component in astrophysical emission regions

→ additional astrophysical component mimicking DM annihilation is a plausible scenario

**Morphological information matters !**
